

The 500mL Bioreactor

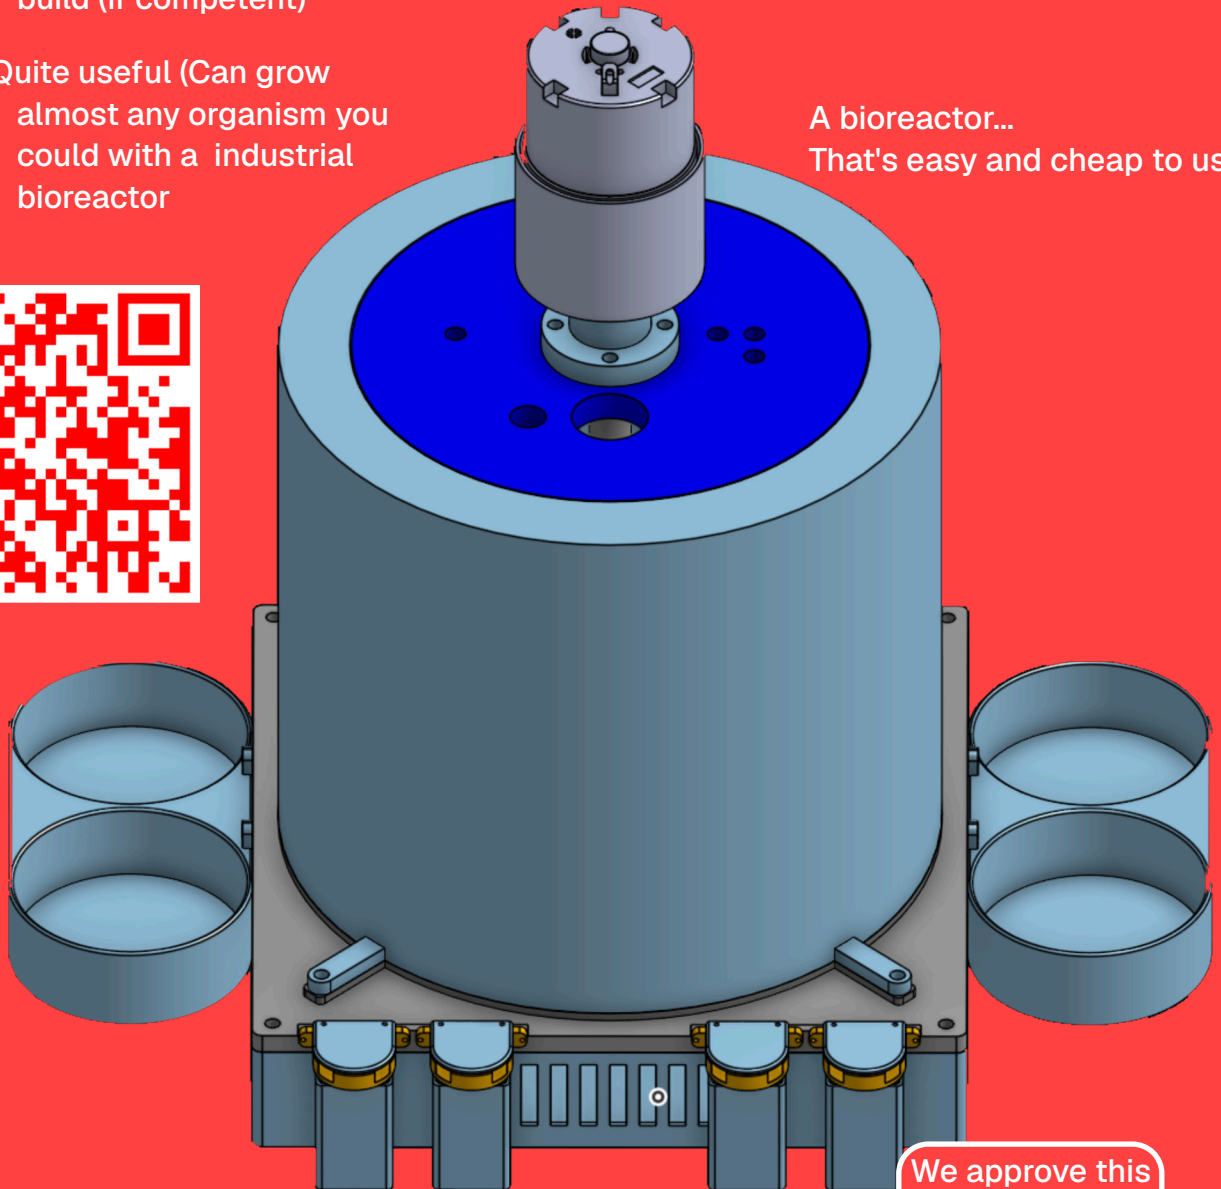

A project by Anahad Khosa (A 14 year old from Canada)

HACK CLUB

- Costs less than a dinner at some restaurants
- Takes less than an hour to build (if competent)
- Quite useful (Can grow almost any organism you could with a industrial bioreactor)

A bioreactor...
That's easy and cheap to use!

A bioreactor, that can:

- Control temperature $\pm 0.5^{\circ}\text{C}$
- Correct pH
- Stir the contents of the reactor at 530 RPM, $0.67\text{ kg}\cdot\text{cm}$
- Read optical density at 600nm
- Can be controlled through a web interface
- Easily be expanded
